ROBA®-DS 9110 / 9210

ROBA®-DS – The backlash-free, torsionally rigid shaft coupling for HBM torque transducers

Characteristics and Advantages

- High precision and reliability
- Optimum running smoothness
- High speeds
- Robust and highly dynamic
- Different designs for optimum set-up

Design

ROBA®-DS disk pack couplings of the type series 9110 and 9210 are especially adapted for the attachment of HBM torque transducers. Different types of construction and flexible combination possibilities permit the integration of measurement flanges in almost every test stand and drive constellation (see the Installation and Operational Instructions B.9110._.).

Function

ROBA®-DS disk pack couplings compensate for **axial**, **radial** and **angular shaft misalignments**. Torque measurement flanges are precision transducers, using which the measurement of extremely small measurement uncertainties can be realised. However, for this purpose several prerequisites are necessary. One of the most important prerequisites is the minimisation of the parasitic loads affecting the transducer, which amongst other things are caused by alignment errors in the drive line. The use of the ROBA®-DS as a torsionally rigid and backlash-free compensating coupling provides the optimum prerequisites in order to achieve exact measurement results of the torque transducer.

Constructional Designs

Standard constructional designs – Type 9110._		
Preferred type of construction (external shrink disk hub)	Type of construction, internal shrink disk hub	Sandwich construction
Compact design	When the set-up of the measurement line from the load side is only possible via a shrink disk hub with internal clamping	Type of construction with maximum shaft misalignment compensation whilst simultaneously being the shortest possible type of construction
Low mass moment of inertia design	Higher mass moment of inertia compared to the "Preferred type of construction"	
Quick installation	Complex installation in comparison to the "Preferred type of construction" as a result of the intermediate flange required	
External clamping of the shrink disks	-	External clamping of the shrink disks

Preferred variant is the shortest and most rigid design.

The couplings are balanced according to DIN ISO 1940 to a balance quality of G 2.5 at n = 3000 rpm.

High-speed constructional design for high speeds – Type 9210._

The individual parts are manufactured to a high level of accuracy (Quality IT5), with restricted shaft run-out and axial run-out tolerance.

The couplings are balanced according to DIN ISO 1940 to a balance quality of G 2.5 at n = 5000 rpm.

T40FH	100,000 to 300,000 Nm	on request ^{1) 2)}

The “internal shrink disk hub” construction and the “sandwich construction” are not possible for the previous model, the torque transducer Type T40.

This restriction does not apply to the torque transducer Type T40B.

1) In this torque range, the shaft coupling must be assigned according to the application.

2) See pages 12 – 13

ROBA®-DS Size	16	64	300	500	850

Dimensions on request

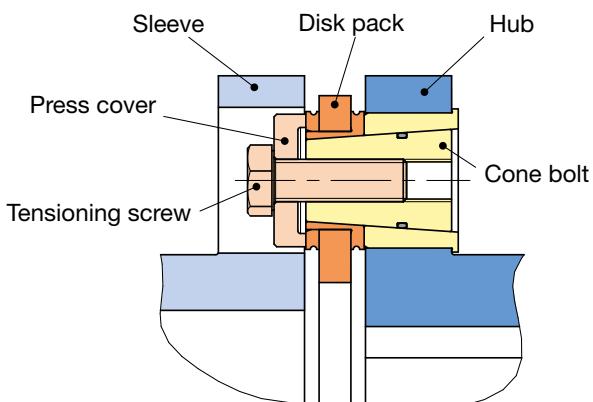

ROBA®-DS for High Torques – Sizes 2200 to 11000

ROBA®-DS with conical connection

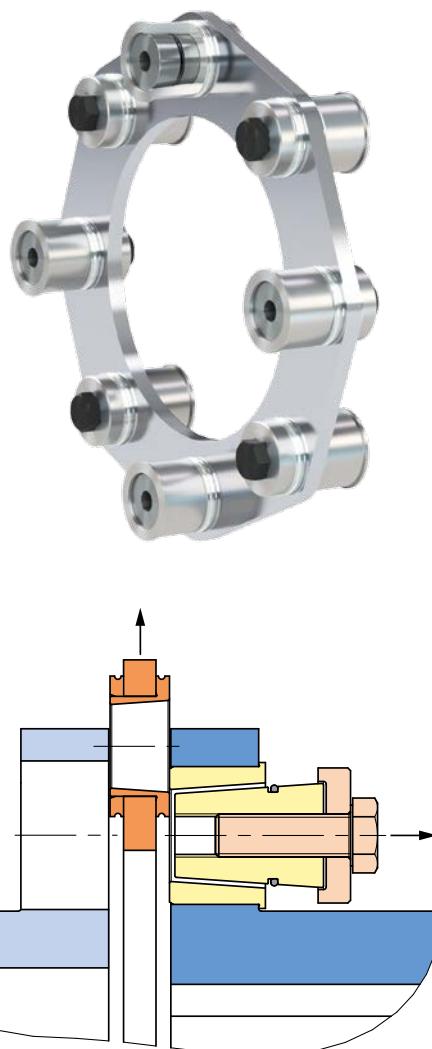

- Low screw tightening torques
- Can be installed / de-installed radially
- Easy and quick installation / de-installation
- No hydraulic installation tools required; can be installed with a torque wrench
- Backlash-free torque transmission
- FEM-optimized disk shape
- High torsional rigidity
- High performance density
- Compensation of axial, angular and radial misalignments
- Wear and maintenance-free
- High flexibility through customer-specific hubs and sleeves

Easy installation and de-installation

Conical connection in installed condition

When installed, the cone bolt is pulled by the tensioning screw into the conical core.

De-installation

For de-installation of the disk pack, the tensioning screw is screwed out and together with the press cover screwed into the cone bolt on the opposite side. This loosens the cone bolt and it can be pulled back axially. In this way, the disk pack and the sleeve can be de-installed radially.

ROBA®-DS for High Torques – Measurement Flange Variants

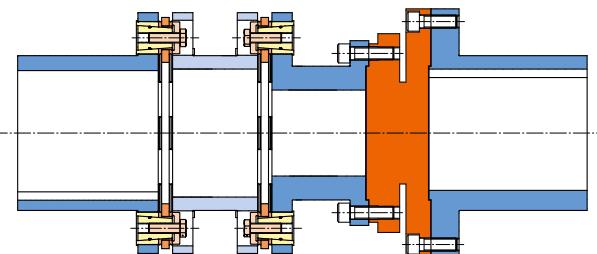

Fig. 1a

Figs. 1a and 1b:

Classic structure for applications with measurement flange. The screw connection on the measurement flange is accessible from the outside. The measurement flange is tied rigidly to the hub.

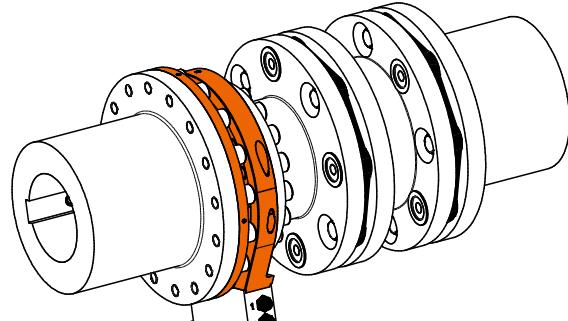

Fig. 1b

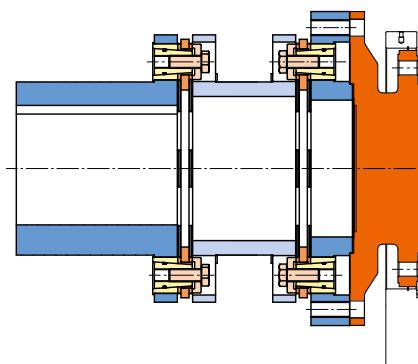

Fig. 2

Direct installation of the measurement flange onto the input or output. This produces a very rigid connection.

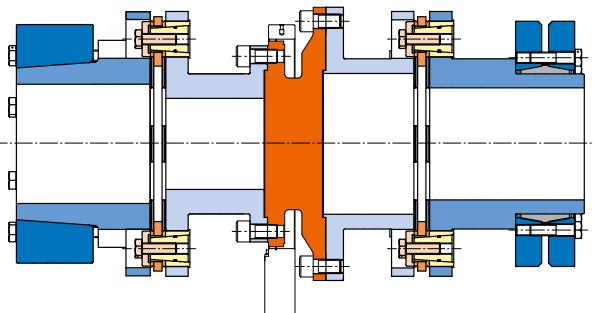

Fig. 3

The measurement flange is positioned between the two disk packs. This way, the measurement flange can be de-installed radially with the sleeve, for example for calibration, without de-installing the hubs. Backlash-free shaft-hub connection via shrink disk hub or hub with external shrink disks ensures maximum precision.

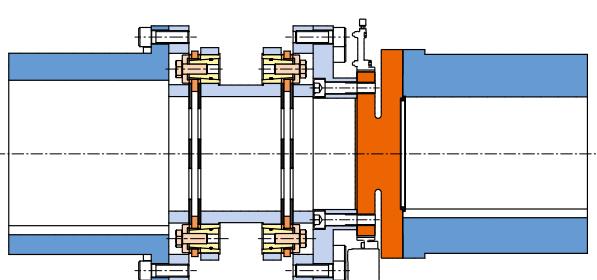

Fig. 4

Diverse connection variants can be implemented through externally bolted flange hubs or internally bolted measurement flanges, e.g. combinations of very different shaft diameters / measurement flange sizes.

Technical Explanations

Coupling alignment

Exact coupling alignment reduces the reaction forces and therefore increases the lifetime of the coupling and the shaft bearing.

This will ensure that the measurement line/drive line runs far more smoothly.

Permitted misalignment of the shaft ends

Should several types of misalignment occur simultaneously, they will influence each other, i.e. the permitted misalignment values are dependent on one another. The sum of the actual misalignment as a percentage of the maximum value must not exceed 100%, see example.

Example (see Table on page 10 and Fig. 5):

ROBA®-DS Size 300, Type 9210.11100

- => An **axial displacement** of $\Delta K_a = 0.16$ mm equates to **40 %** of the permitted maximum value $\Delta K_a = 0.4$ mm.
- => A simultaneously occurring **angular misalignment** in the disk pack of $\Delta K_w = 0.048^\circ$ equates to **30 %** of the permitted maximum value $\Delta K_w = 0.16^\circ$.
- => From this, a still-permitted **radial misalignment** of $\Delta K_r = 30\%$ results from the maximum value $\Delta K_r = 0.08$ mm, i.e. maximum **0.024 mm** is permitted.

Valid standards

Coupling characteristic values according to DIN 740, Part 2, Section 2.1.

Stress dimensions according to DIN 740, Part 2, Sections 2.2 and 3 (dimensioning of the coupling for special applications). Coupling dynamically balanced according to ISO 1940.

General guidelines for installation

The disk packs of the coupling must not be overexpanded beyond the stated permitted flexibilities!

Installation position

The ROBA-DS® shaft coupling with the torque measurement flange can be operated in any installation position (horizontal or vertical). In case of vertical operation, please make sure that the permitted axial force is not exceeded by the test stand-side masses.

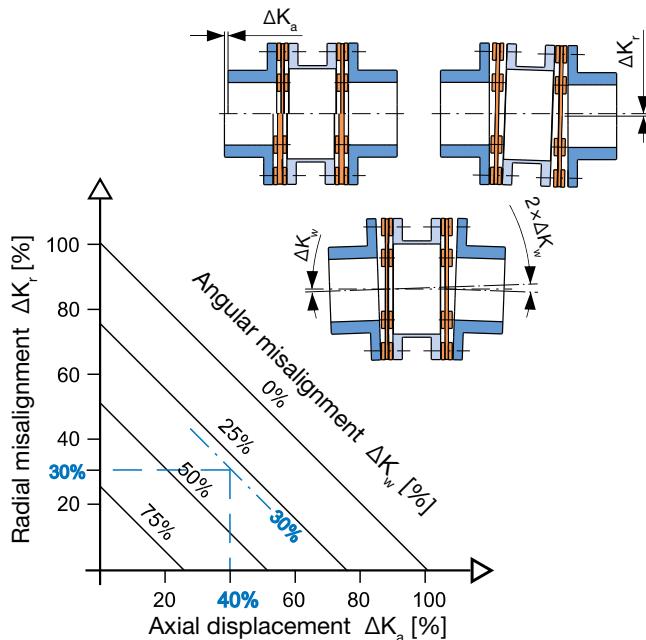

Fig. 5

Product Summary

Torque Limiters/Overload Clutches

- EAS®-Compact®/EAS®-NC/EAS®-smartic®**
Positive locking and completely backlash-free torque limiting clutches
- EAS®-reverse**
Reversing re-engaging torque limiting clutch
- EAS®-element clutch/EAS®-elements**
Load-disconnecting protection against high torques
- EAS®-axial**
Exact limitation of tensile and compressive forces
- EAS®-Sp/EAS®-Sm/EAS®-Zr**
Load-disconnecting torque limiting clutches with switching function
- ROBA®-slip hubs**
Load-holding, frictionally locked torque limiting clutches
- ROBA®-contitorque**
Magnetic continuous slip clutches
- EAS®-HSC/EAS®-HSE**
High-speed torque limiters for high-speed applications

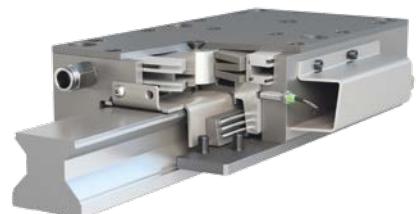

Shaft Couplings

- smartflex®/primeflex®**
Perfect precision couplings for servo and stepping motors
- ROBA®-ES**
Backlash-free and damping for vibration-sensitive drives
- ROBA®-DS/ROBA®-D**
Backlash-free, torsionally rigid all-steel couplings
- ROBA®-DSM**
Cost-effective torque-measuring couplings

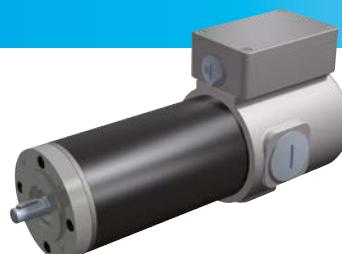

Electromagnetic Brakes/Clutches

- ROBA-stop® standard**
Multifunctional all-round safety brakes
- ROBA-stop®-M motor brakes**
Robust, cost-effective motor brakes
- ROBA-stop®-S**
Water-proof, robust monoblock brakes
- ROBA®-duplostop®/ROBA®-twinstop®/ROBA-stop®-silenzio®**
Doubly safe elevator brakes
- ROBA®-diskstop®**
Compact, very quiet disk brakes
- ROBA®-topstop®**
Brake systems for gravity loaded axes
- ROBA®-linearstop**
Backlash-free brake systems for linear motor axes
- ROBA®-guidestop**
Backlash-free holding brake for profiled rail guides
- ROBATIC®/ROBA®-quick/ROBA®-takt**
Electromagnetic clutches and brakes, clutch brake units

DC Drives

- tendo®-PM**
Permanent magnet-excited DC motors
